There really are only two acceptable models of development: "think and analyze" or "years and years of testing on thousands of machines".

nodeJS

We found node

nodeJSTM

We found node

We fell in love

We had fun

We crashed

Transloadit v1

- Complete failure
- Node randomly crashed with:
(evcom) recv() Success
- A mess of code, hard to maintain

We had no tests

Time to rewrite

How to Test Asynchronous Code

```
db.query('SELECT A', function() {  
  db.query('SELECT B', function() {  
    db.query('SELECT C', function() {  
      db.query('SELECT D', function() {  
        // WTF  
      });  
    });  
  });  
});
```

Some old news

How to Test Asynchronous Code

Make it “synchronous”

Version 2

Well, almost :)

Transloadit v2

Now

- Processed many TB of data
- Very low bug rate
- Clean code base, ~99% test coverage

How to Microtest Node.js Code

Rule #1: No I/O

Rule #2: TDD

Rule #3: Discipline

Libraries

felixge/node-fake

felixge/node-microtest

node-microtest

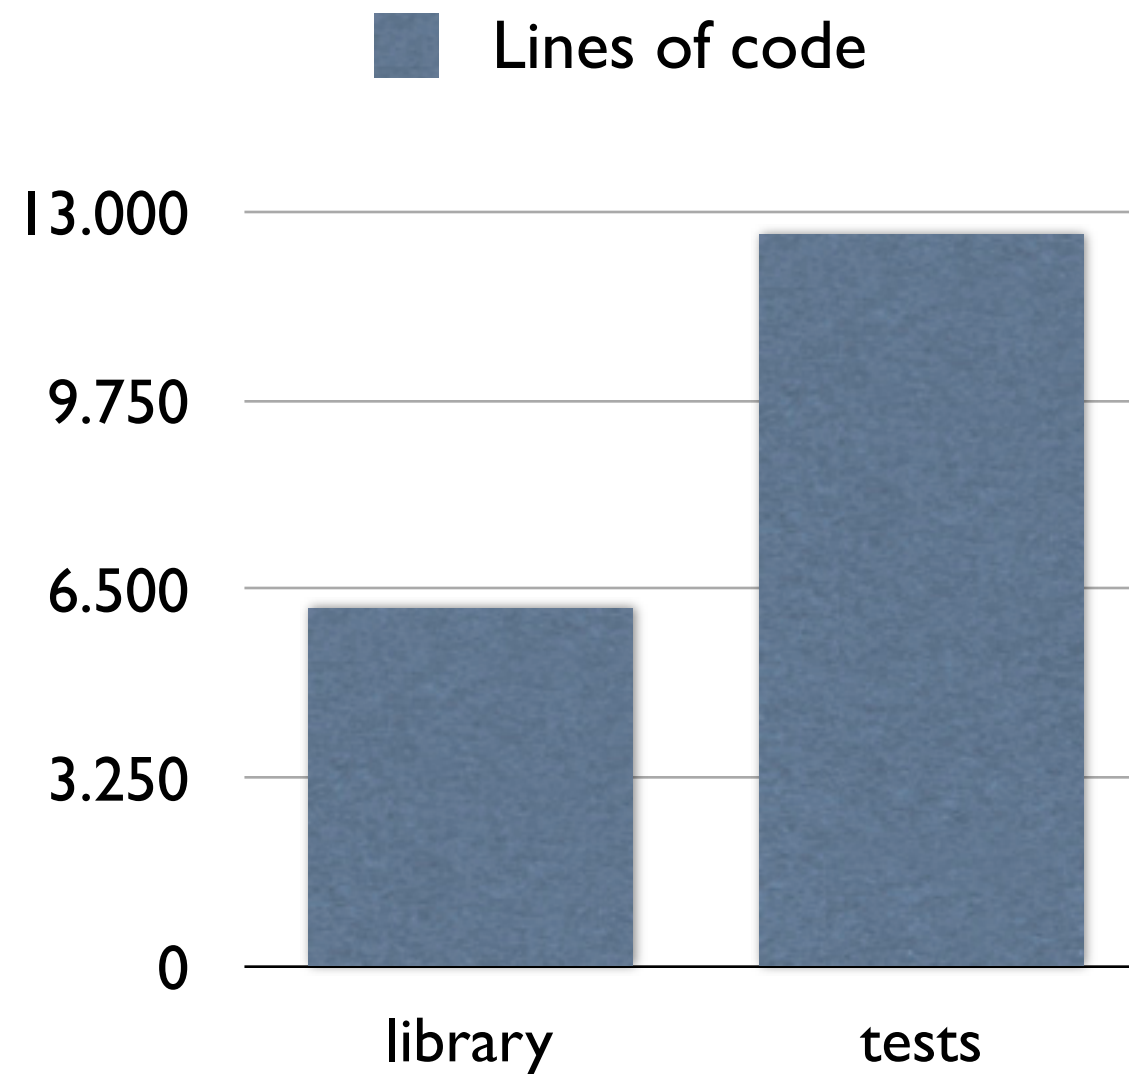

- Load test files in separate v8 context
- node-fake as mixin
- Basic test.describe(name, fn) framework

felixge/node-far

Why do you have brakes in a car?
Because then you can drive faster.

Kevlin Henney

tl;dr

- Don't use integration tests to show the basic correctness of your software.
- Write more microtests.
